

Tissue Management Protocol for Chairside Digital Impressions

1. Swab gingiva with ferric sulfate.
2. Soak epinephrine-impregnated retraction cord in aluminum chloride. Gingi-Pak Max Original 2-ply cotton works well.
3. Pack cord. Don't pack too deep. Will have better lateral retraction.
4. Leave cord in place for 5 minutes.
5. Rinse.
6. Remove cord (wet).
7. Dry the prep area.
8. Powder the area to be scanned if necessary.
9. Scan immediately.
